

# Essential Git Commands

A Comprehensive Reference for Version Control

by: [github.com/nathanaelsanilo](https://github.com/nathanaelsanilo)

Command	Action
<code>git init</code>	Initializes a new Git repository in the current directory, setting up version control.
<code>git clone [url]</code>	Creates a local copy of a remote Git repository, including its full history.
<code>git add [file]</code>	Stages a specific file's changes for the next commit.
<code>git add .</code>	Stages all changes (new, modified, deleted files) in the current directory for the next commit.
<code>git commit -m "Your message"</code>	Records staged changes as a new commit with a descriptive message.
<code>git status</code>	Displays the current state of the working directory and staging area.
<code>git diff</code>	Shows differences between various states (e.g., working directory vs. staging).
<code>git log</code>	Displays the chronological history of commits.
<code>git branch</code>	Lists all local branches in the repository.
<code>git branch [branch-name]</code>	Creates a new branch at the current commit.
<code>git checkout [branch-name]</code>	Switches the working directory to the specified branch.
<code>git checkout -b [new-branch-name]</code>	Creates a new branch and immediately switches to it.
<code>git merge [branch-name]</code>	Integrates changes from the specified branch into the current branch.
<code>git pull</code>	Fetches and merges the latest changes from the remote repository.
<code>git push</code>	Uploads local commits to the remote repository.
<code>git remote -v</code>	Lists configured remote repositories and their URLs.
<code>git remote add origin [url]</code>	Establishes a connection to a new remote repository named "origin."
<code>git rm [file]</code>	Deletes a file from the working directory and stages its removal.
<code>git mv [old-name] [new-name]</code>	Renames or moves a file and stages the change.
<code>git reset [file]</code>	Unstages a file, moving its changes back to the working directory.
<code>git reset --hard [commit-hash]</code>	Resets the branch and working directory to a specific commit, discarding subsequent changes.
<code>git reset --soft [commit-hash]</code>	Resets the branch to a specific commit, preserving subsequent changes in the staging area.
<code>git revert [commit-hash]</code>	Creates a new commit that undoes the changes of a previous commit.
<code>git stash</code>	Temporarily saves uncommitted changes, cleaning the working directory.
<code>git stash pop</code>	Applies the most recent stashed changes and removes them from the stash list.
<code>git tag [tag-name]</code>	Creates a lightweight tag pointing to a specific commit.
<code>git tag -a [tag-name] -m "Message"</code>	Creates an annotated tag with a message, pointing to a specific commit.
<code>git fetch</code>	Downloads new data from a remote repository without merging.
<code>git config --global user.name "Your Name"</code>	Sets the global Git username for commits.
<code>git config --global user.email "your_email@example.com"</code>	Sets the global Git email address for commits.
<code>git config --list</code>	Displays all Git configuration settings.
<code>git rebase [branch-name]</code>	Rewrites commit history by moving or combining commits to a new base.
<code>git cherry-pick [commit-hash]</code>	Applies the changes introduced by an existing commit from another branch onto the current branch.
<code>git reflog</code>	Shows a log of all actions performed in the repository, including those that rewrite history.
<code>git submodule add [url] [path]</code>	Adds a Git repository as a submodule of the current repository.
<code>git bisect</code>	Helps find the commit that introduced a bug by performing a binary search on the commit history.
